

Helping You Transport Used N95 Respirators Safely

The U.S. Food and Drug Administration has authorized the STERIS Sterilization System for use in decontaminating compatible N95 or N95-equivalent respirators for reuse by healthcare personnel in healthcare facilities. The healthcare facility should ensure that the chain of custody is maintained to minimize risk of cross-contamination.

Protective Collection Container

Nest & Stack Tote
35200Red
35200Blue

Follow these steps to prepare masks for decontamination:

1. Used compatible N95 respirators should be placed in a Tyvek pouch and sealed.
2. The pouched, compatible N95 respirator should be placed at the healthcare facility's designated collection station (try an Akro-Mils' Nest & Stack Tote!)
3. The Tyvek pouches should be collected from the collection station and placed into an appropriate container for transportation, such as a closed case cart, to minimize risk of environment contamination (try a Jamco Products stainless steel closed cart – we have silent casters, ergonomic handle options, and options for autoclave, conductive, and thermoplastic rubber casters!)
